

# Did Beach Nourishment Save the Jersey Shore During Sandy?

Andy Coburn and Adam Griffith  
Program for the Study of Developed Shorelines  
Western Carolina University

# **Program for the Study of Developed Shorelines (PSDS):**

- Applied research center at Western Carolina University involved in the development and implementation of responsible, science-based coastal management strategies that promote the long-term sustainability of our nation's developed shorelines.
- Established in 1985 at Duke University
- Moved to WCU in 2006

**WCU**

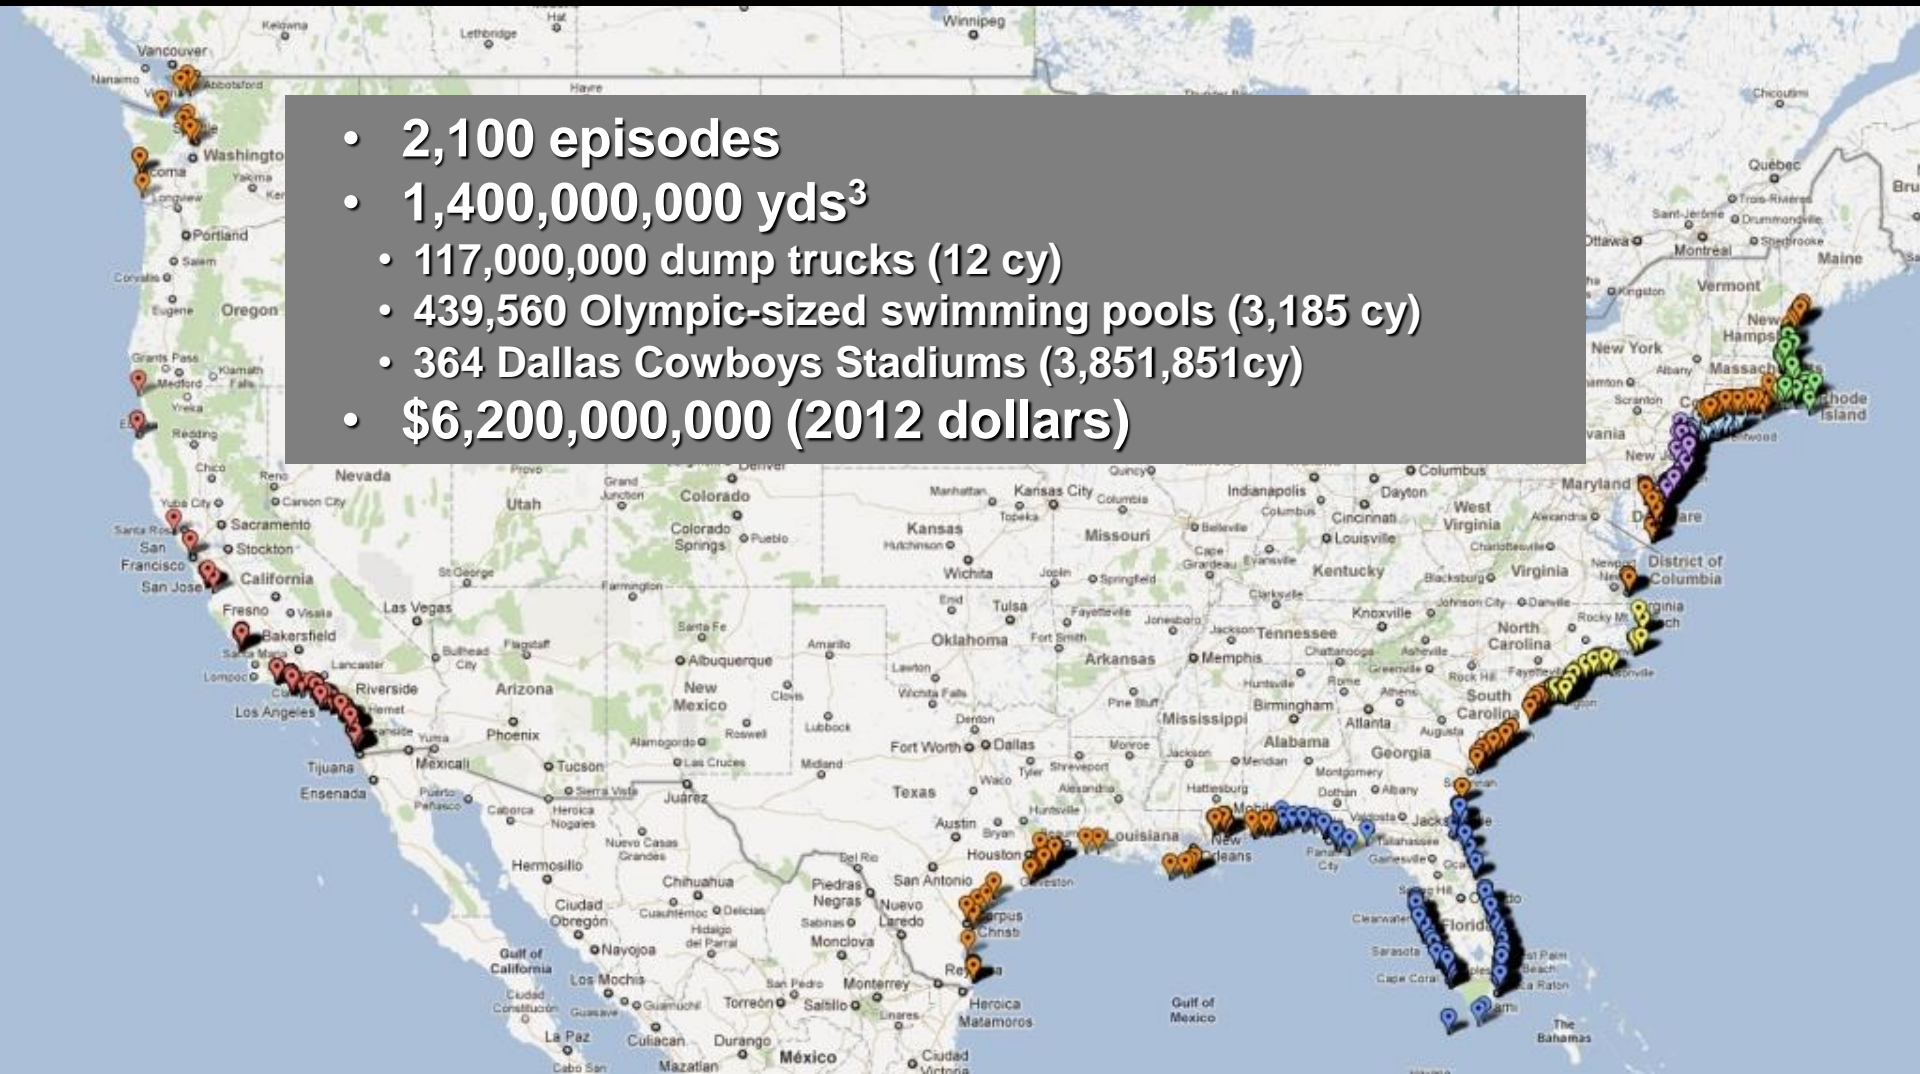

# Beach Nourishment

# Since 1922...

- 2,100 episodes
- 1,400,000,000 yds<sup>3</sup>
- 117,000,000 dump trucks (12 cy)
- 439,560 Olympic-sized swimming pools (3,185 cy)
- 364 Dallas Cowboys Stadiums (3,851,851cy)
- \$6,200,000,000 (2012 dollars)

# BEACH NOURISHMENT VIEWER

PROGRAM FOR THE STUDY OF DEVELOPED SHORELINES @ WESTERN CAROLINA UNIVERSITY

## NORTH CAROLINA

Select a beach

Select another state

### STATE TOTALS: EPISODES:

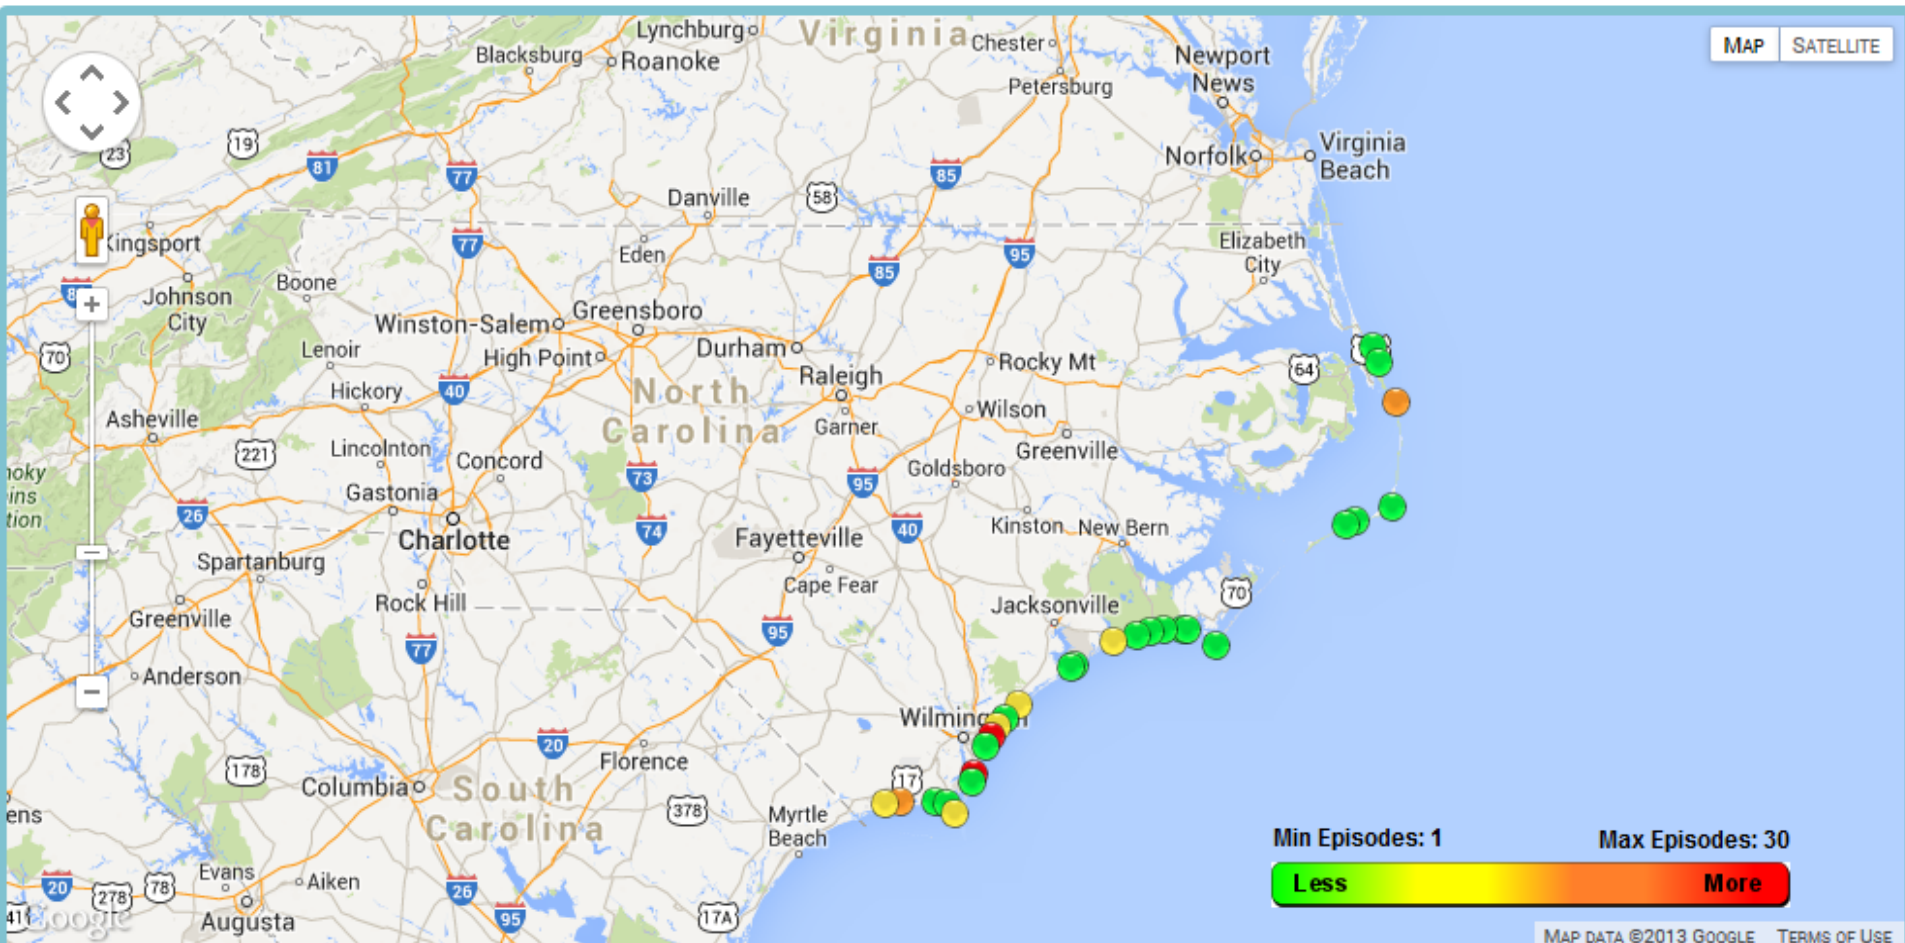

215

COST: \$455,846,981

COST (IN 2012 DOLLARS): \$613,269,809

VOLUME (CUBIC YARDS): 107,377,507

LENGTH (FEET): 1,132,463

# BEACH NOURISHMENT VIEWER

PROGRAM FOR THE STUDY OF DEVELOPED SHORELINES @ WESTERN CAROLINA UNIVERSITY

## NEW JERSEY

Select a beach

Select another state

STATE TOTALS: EPISODES:

310

COST:

\$851,565,897

COST (IN 2012 DOLLARS):

\$1,222,134,321

VOLUME (CUBIC YARDS):

158,380,422

LENGTH (FEET):

880,484

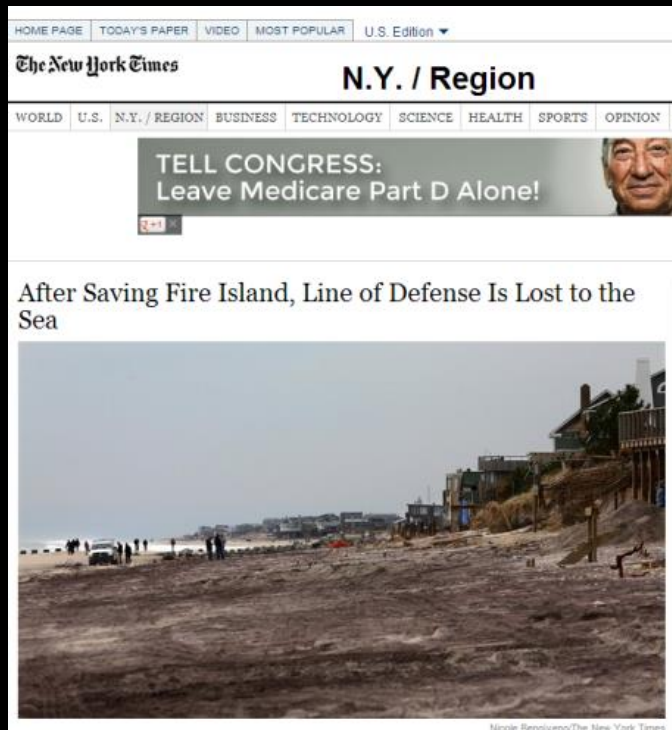

SORT BY: ● EPISODES ● COST ● VOLUME (CUBIC YARDS)

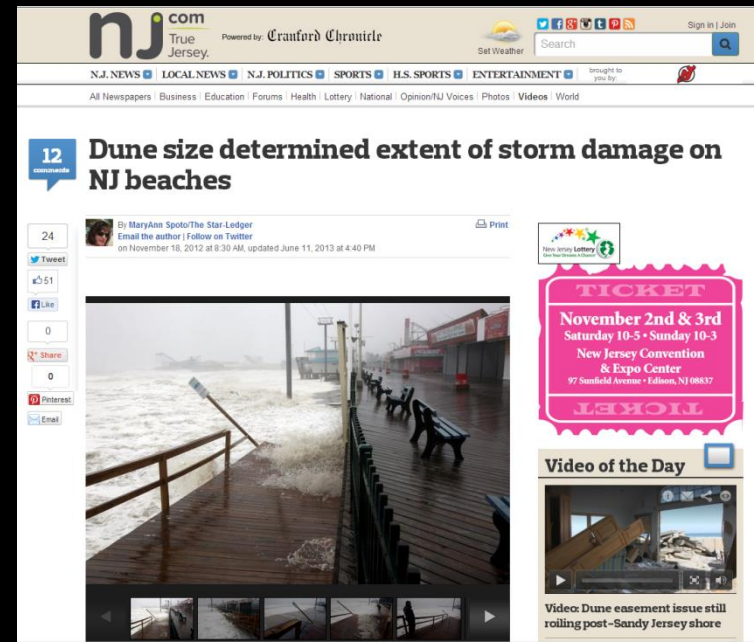

# REPORTING AFTER SANDY

**"If you look at the towns that have had engineered beaches, up and down the state, those are the towns whose damage was minimal." Other towns that didn't, the damage was much greater. I think that's a lesson for us as we move forward." – NJ Gov. Chris Christie**

**One thing is clear: Communities that were protected by a federally constructed beach project fared much better during the storm than their non-project counterparts.**

**— JOHN HARMS, ASBPA Government Affairs Advisor**

HOW LIKELY IS IT THAT  
AN INUNDATED HOME  
WAS LOCATED BEHIND A  
NOURISHED BEACH?

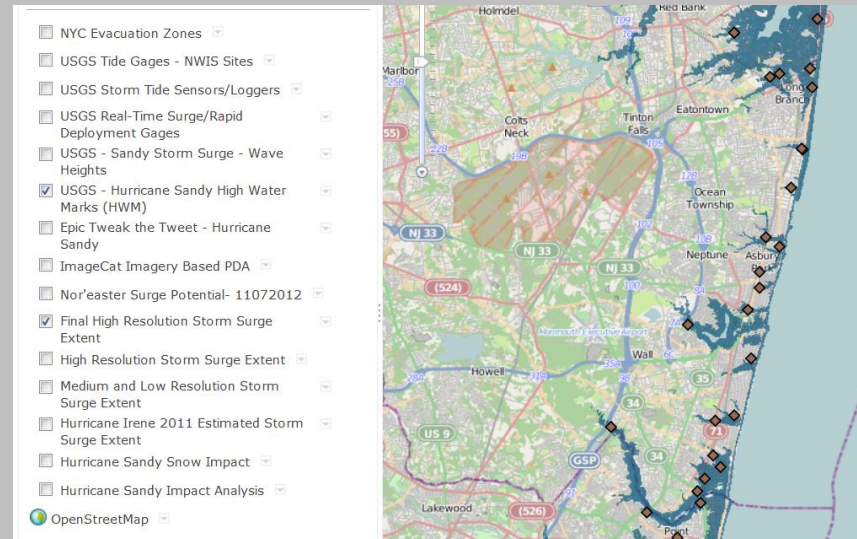

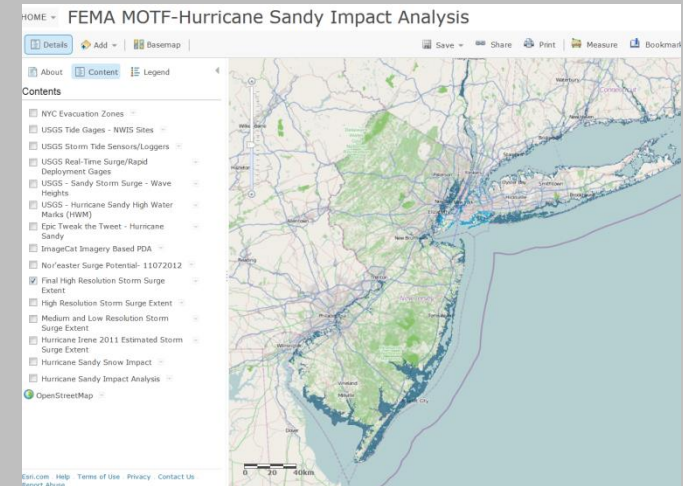

# DATA SOURCES

Data Type	Data Source
NJ Coastline	NJ Dept. of GIS
Damage	FEMA-MOTF v 28
Inundation	FEMA/USGS
Beach width	Richard Stockton College
Dune height	ACOE Pre-Sandy LiDAR (2010)
Nourishment	PSDS
Elevation	ACOE Pre-Sandy LiDAR (2010)

# DATA: FEMA-MOTF

- Individual damages to homes based on remote sensed data (v 28)
  - Categories: Affected, major, minor, and destroyed
  - Some ground truthing
- Surge inundation levels based on models USGS/FEMA high water marks
  - Less than 1% error

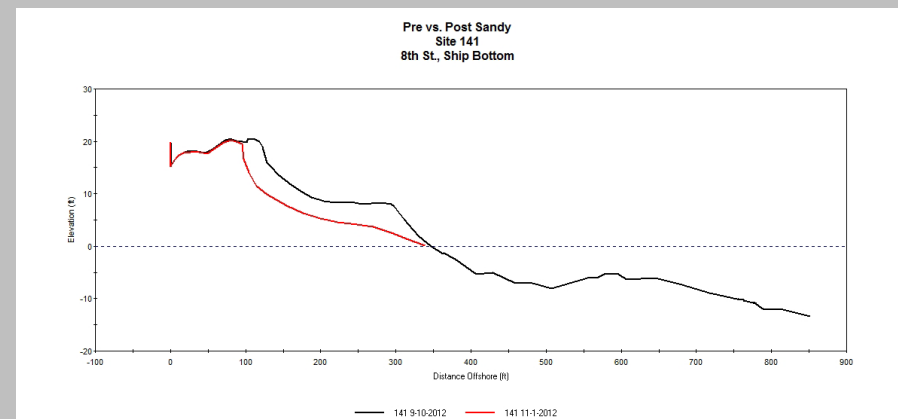

# DATA: NOURISHMENT

- Program for the Study of Developed Shorelines dataset
- Only one of its kind

# DATA: BEACH CHARACTERISTICS

- Richard Stockton College Beach Profile Network
  - Pre and post storm high resolution beach profiles
  - Beach width
  - Dune height

# DATA: ELEVATION

- 2010 Army Corps of Engineers LiDAR based DEM

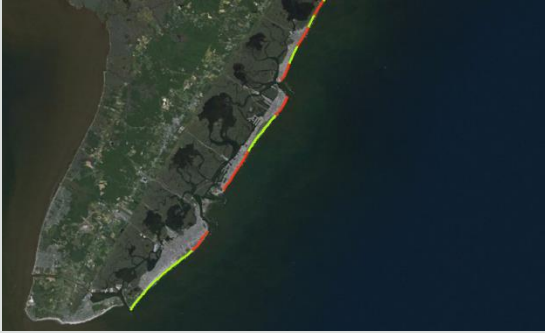

Source: Esri, DigitalGlobe, GeoEye, i-cubed, USDA, USGS, AEX, Getmapping, Aerogrid, IGN, IGP, and the GIS User Community

Source: Esri, DigitalGlobe, GeoEye, i-cubed, USDA, USGS, AEX, Getmapping, Aerogrid, IGN, IGP, and the GIS User Community

# APPROACH

Action	Rationale	Image
Use damage from seaward most structure for coast of New Jersey	Seaward most structure most likely to benefit from nourishment	 An aerial photograph of a coastal area. A dense cluster of red dots is located inland, while a line of yellow dots follows the coastline. The ocean is visible on the right side of the image.
Cut houses at inlets out of analyses	Inlet geomorphology too complex	 An aerial photograph of a coastal area. A line of yellow dots follows the coastline. The ocean is visible on the right side of the image.
Use only beaches nourished since 2000 in analyses	Sand is transient and likely does not last 12 years in many places in NJ	 An aerial photograph of a coastal area. A line of yellow dots follows the coastline. The ocean is visible on the right side of the image.

# LIMITATIONS

- Front row of development
- Increased error in inundation model from sampling only front row structures
- Inundation based on model
- FEMA damage estimates lack resolution – Y or N  
“affected” carries same weight as “minor” carries same weight as “destroyed” home

# DATA - OVERVIEW

## First row method

	total	non-nourished	nourished
Affected		2125	1157
Destroyed		112	18
Major		62	53
Minor		144	117
	3788	2443	1345

-  $18/130 = 14\%$  of destroyed homes behind nourished beaches

- **Expected value = 37%**

## 1000 foot buffer

	total	non-nourished	nourished
Affected		8792	4500
Destroyed		354	21
Major		216	73
Minor		1872	528
	16356	11234	5122

$21/375 = 5.6\%$  of destroyed homes behind nourished beaches

# LOGISTIC REGRESSION

- **Dependent variables from FEMA-MOTF data:**
  - Inundation – Y or N - 1% error, prior to sampling
  - Damage – Y or N - remote damage assessments with some ground truthing
  - Y = affected, minor, major, destroyed categories
- **Independent variables:**
  - Beach width, dune height, structure elevation, structure distance from MHW

# RESULTS - INUNDATION AS DEPENDENT VARIABLE

Coefficients:					
	Estimate	Std.	Error	value	Pr(>  z )
(Intercept)	4.077	0.179	22.749	2.00E-16	***
Beach Width	-0.003	0.000	-8.448	2.00E-16	***
Structure Elevation	-0.020	0.010	-2.124	0.0336	*
Structure Distance	-0.003	0.000	-21.799	2.00E-16	***
Nourished1	-0.436	0.081	-5.367	8.02E-08	***

- Intuition prevails!
- Homes behind nourished beaches were LESS likely to be inundated.
- Homes on wider beaches, higher ground, and far from coast were also LESS likely to be inundated.

# RESULTS - DAMAGE AS DEPENDENT VARIABLE - DESTROYED AND MAJOR DAMAGE

Coefficients:					
Estimate	Std.	Error	z	value	Pr(>   z   )
(Intercept)	4.170	0.448	9.309	2.00E-16	***
BeachWidth	-0.012	0.001	-9.546	2.00E-16	***
StructureE	-0.071	0.019	-3.757	0.000172	***
StructDist	-0.004	0.000	-8.001	1.24E-15	***
Nourished1	-1.608	0.210	-7.645	2.09E-14	***

- Intuition prevails again!
- Homes on the front row were **MORE** likely to be damaged IF they were at a **LOWER** elevation.
- Nourishment highly correlated with damage field.

# NEXT STEPS

- Power analysis
  - $n \sim 5000$
- Analyze New York (Long Island) data the same way
- So what?
  - Like all models, these numbers should be approached with caution, BUT I think the results are real.
  - Engineer the entire coast of NJ?\*

**\*Although we are not promoting beach nourishment as a solution to beach erosion/storm damage reduction...**
